Tell us what your idea is.

Sexual assault is a very common form of crime nowadays, which is also increasing day by day and is very alarming. One form of sexual assault is rape. According to wikipedia more than 250,000 cases of rape is reported every year, over 65 counties. And the larger portion of rape attemt or rape cases went into dark. Reasons behind rape may vary from county to country, but these could be stopped, if local law inforcement and community colaborate. **My idea is to measure tension using camera or microphone. So when a girl is being sexually assaulted, the local authority will know first, then the community if needed as in under-developed countries community is stronger than local law enforcement.**

Tell us how you plan on bringing it to life.

It is an idea, but not just a random idea flying through my head right now. I have been working on these types of projects. Previously I used google maps to share location, when a button was pressed. But the main potential and challange is to automate this, detect sexual assault automcatically as majority of the victim is not able to press that button on that very specific moment. Please see the itinerary below :

- **January 1 - January 2, 2020** *- Make old projects open source.*
- **January 3 - January 20, 2020** *- Case study, deeper understanding.*
- **January 21 - January 31,2020** *- Initial planning*
- **February 1 - April 15,2020** *- Iterative development(Requirement analysis, design and coding, testing, evaluation)*
- **April 16 - April 30,2020** *- Preparation for release*

Tell us about you.

Hello, I'm Maifee Ul Asad, student of CSE. I am interested in automation. I am from a small country Bangladesh, with a lot and big problems. But I believe that obstacles are placed in front of us to learn, to make us better. So I can tell you that, it is a land of opportunities too. Rape is a common social problem here, so I'm trying to fix that thing, it would be very nice to work with Google in such an interresting topic.
